How to Set Up Weather Underground®

Syncing weather station data from WeatherMaster™ or the Weather MicroServer™ to Weather Underground is an easy way to share and view your weather station information online. Weather Underground comes with many monitoring features, and allows you to view data from stations around the world.

Some of the features available include real-time monitoring, data maps, historical data and graphs, weather cams, and radar. You can also access these features from an iPhone or Android device through their app.

A Weather Underground Account and Station ID Number are required before you can link your weather station.

Creating a Weather Underground Account

2. Go near the bottom of their homepage. Under GET STARTED click Connect Now, or click this Link.

3. Walk through the steps outlined by entering in the appropriate information about where your weather station is, or will be.

4. Once you submit, you will receive a Station ID Number.
Setting Up with the MicroServer

1. To connect through the MicroServer, login to Device Admin and click on Data Output

2. For the Weather Underground Output, select Enabled.

3. Click Settings for the Weather Underground Output

4. Enter your Weather Station ID and your Weather Underground Account Password, and click OK. It will then take you back to the Data Output Screen.

5. Click Apply Changes

Be sure to enter in your own Station ID, not the one shown above.

Setting Up with WeatherMaster

1. To enable the feature in WeatherMaster, click Weather Underground from the Options menu.

2. Enter your Weather Underground Station ID and password.

3. Click OK.

4. WeatherMaster uploads the weather data every 5-minutes to Weather Underground.

*Be sure to enter in your own Station ID, not the one shown above.*
Completed Set-Up

Once you have completed one of the Set-Ups, you should now be able to view weather station data in real-time from the Weather Underground website, or mobile app.
